                              Detecting, preventing and treating sensitivity to cat protein allergen comprises combining a biological sample with a human {\tt T} cell reactive feline protein and determining the extent of binding that occurs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a modified human T-cell reactive feline protein which stimulates T-cells from an individual who is allergic to cats, but which interacts with human IgE to a lesser extent than does affinity purified TRPP! The protein is modified by treating with either a mild alkali (pH 12.5-13.5, KOH, NaOH, LiOH or tertiary amines) or an enzyme which removes O-linked groups (carbohydrate modifies). It is useful in desensitising people who are allergic to cats.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to the detection of sensitivity to a cat protein allergen by combining a blood sample from a subject with a peptide of human real reactive feline protein (hTRFP). This method and the hTRFP peptides are useful for diagnosing, preventing and treating cat allergies by reducing or abolishing an individual's allergic response to a cat allergen. DNA encoding the TRFP may be used as probes to locate equivalent sequences present in other species. These may further be used to study the mechanism of immunotherapy of cat allergy, and to design modified derivatives, analogues or functional equivalents useful in immunotherapy. The present sequence was used in the invention.

New human T cell reactive feline protein useful for reducing abolishing individual's allergic response to cat allergen cortwo different covalently linked peptide chains \cdot

Claim 2; Column 75-76; 106pp; English.

invention describes a novel naturally occurring cat protein allergen human T cell reactive feline protein (TRFP), comprising two

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC different covalently linked peptide chains with a molecular weight of 20 CC kD, 40 kD or 130 kD under non-reducing conditions and 5 kD or 10-18 kD CC under reducing conditions. The products of the invention have CC antiallergic activity and act as human T cell stimulators. TRFP is useful CC for reducing or preventing the adverse effects of cat allergens on cat CC ellergic individuals and in ex vivo diagnostic tests to determine which CC peptides cause sensitivity so as to selectively use them to desensitize CC act sensitive individual. Purified TRFP is also useful for studying CC the mechanism of immunotherapy of cat allergy and to design modified CC derivatives, analogs or functional equivalents that are more useful in CC immunotherapy against cat allergy. DNA sequences present in other species (goats, sheep, dogs, rabbits or horses) that may be useful in diagnostics CC and/or therapeutics. Fully defined and characterized TRFP provides CC complete and a very simple desensitization therapy. This sequence CC represents a human T cell reactive feline protein (also known as Fel d I) CC chain 2, long form which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

The protein is a cat protein allergen, and was isolated from a vacuum bag extract obtained by affinity purification of house dust collected from several homes with cats. TREP is composed of two covalently linked peptide chains, and is also referred to as Fel d I. TREP and its peptides are useful for reducing or preventing the adverse effects that exposure to cat allergens normally has on cat allergic individuals (i.e. to desensitise individuals to cat allergens or block the effect of the allergens) TREP is also used in methods of diagnosing sensitivity to Felis domesticus in an individual. DNA sequences encoding TREP can be used as probes to locate equivalent sequences present in other species, e.g. goat, sheep, horse, rabbit and dog, that may be useful in a diagnostic and/or therapeutic applications.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel peptide (I) of human T cell reactive feline protein (hTRFP) having at least one T cell epitope recognized by a T cell receptor specific for the human T cell reactive feline protein, the peptide consisting of at least 7-30 amino acids, and having an amino acid sequence derived from an amino acid sequence cerived from an amino acid sequence cerived from an amino acid sequence objected for the specification. The peptides have reduced lumunoglobulin E binding and reduce T cell responsiveness. The peptide (I) is useful in compositions for treating sensitivity to a cat protein allergen in a subject. This sequence represents the human TRFP chain 2 (long form).
                                                                                                                                                              29-APR-1993
                                                                                                                                                                                  WO9308280-A
                                                                                                                                                                                                                                                     Felis.

T cell epitope studies using overlapping regions derived from the TREP maino acids sequence were used identify multiple T cell epitopes in each chain of TREP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombitope peptide having T-cell stimulating activity - for diagnosis and treatment of sensitivity to protein allergens auto:antigens and protein antigens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide

                     This invention describes a novel method of desensitizing a patient to a polypeptide allergen and comprises administering to the patient a peptide derived from the allergen where restriction to a MHC Class II molecule possessed by the patient can be demonstrated for the peptide and the peptide is able to induce a late phase response in an individual who possesses the MHC Class II molecule. The methods can be used for desensitising patients to allergens present in e.g. grass, tree and we (including ragweed) pollens, fungi and moulds, foods, stinging insects,
                                                                                                                                                                                                                                                                                                                                                                                                                            Kay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21-SEP-1998;

```

Poly-A mRNA from cat parotid and mandibular glands was used to produce cDNA clones for both chain 1 and chain 2 of TRFP. The clones were then used to screen a cat genomic library. Chain exists in two forms having different leader sequences (A and The sequence can be used to express the protein and peptide of which stimulate T-cells in persons allergic to cats. The pep

The present invention relates to the detection of sensitivity to a cat protein allergen by combining a blood sample from a subject with a peptide of human T cell reactive feline protein (hTRFP). This method and the hTRFP peptides are useful for diagnosing, preventing and treating cat allergies by reducing or abolishing an individual's allergic response to a cat allergen. DNA encoding the TRFP may be used as probes to locate equivalent sequences present in other species. These may further be used to study the mechanism of immunotherapy of cat allergy, and to design modified derivatives, analogues or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 modificn. of lymphokine prodn. by the T-cells. They can also be used to identify epitopes responsible for sensitivity. The DNA can be used to detect comparable sequence in other species, and also for prodn. of modified forms of TRFP esp. showing reduced binding to IgE and thus reduced tendency to cause adverse reactions. This invention describes a novel naturally occurring cat protein allergen (1), human T cell reactive feline protein (TRFP), comprising two different covalently linked peptide chains with a molecular veight of 20 kp, 40 kp or 130 kp under non-reducing conditions and 5 kp or 10-18 kp under reducing conditions. The products of the invention have antiallergic activity and act as human T cell stimulators. TRFP is useful for reducing or preventing the adverse effects of cat allergens on cat allergic individuals and in ex vivo diagnostic tests to determine which peptides cause sensitivity so as to selectively use them to desensitize a cat sensitive individual. Purified TRFP is also useful for studying the mechanism of immunotherapy of cat allergy and to design modified the mechanism of immunotherapy of cat allergy and to design modified derivatives, analogs or functional equivalents that are more useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               02-SEP-1994;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            immunotherapy against cat allergy. DNA sequences encoding TRFP are useful as probes to locate equivalent sequences present in other species (goats, sheep, dogs, rabbits or horses) that may be useful in diagnostics and/or therapeutics. Fully defined and characterized TRFP provides complete and a very simple desensitization therapy. This sequence represents a human T cell reactive feline protein (also known as Fel d I)
This invention describes a novel peptide (I) of human T cell reactive feline protein (hTRFP) having at least one T cell epitope recognized by a T cell receptor specific for the human T cell reactive feline protein, the peptide consisting of at least 7-30 amino acids, and having an amino acid sequence derived from an amino acid sequence comprising 94. 96. 97, 109, or 111 residues, given in the specification. The peptides down regulate the immune response to the allergen. The peptides have
                                                                                                                                                Peptides of human T cell reactive feline protein sensitivity to cat protein allergens comprise at epitope recognized by a T cell receptor specific
                                                                                                            Example 1; Column 83-84; 105pp; English.
                                                                                                                                                                                                           WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunoglobulin E binding and reduce T cell responsiveness. (I) is useful in compositions for treating sensitivity to a allergen in a subject. This sequence represents the human T (long form).
                                                                                                                                                                                                                                                                                                                                                                 AAQ11840

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cat
```

produce cDNA clones for both chain 1 and chain 2 of TRFP. These clones were then used to screen a cat genomic library. Chain 1 exists in two forms having different leader sequences (A and B). The sequence can be used to express the protein and peptide derivs which stimulate T-cells in persons allergic to cats. The peptides can be used to reduce/ellminate the allergic response partic. by

used to modificn.

n. of lynphokine prodn. by the T-cells. They condentify epitopes responsible for sensitivity. to detect comparable sequence in other species.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
          The present invention relates to the detection of sensitivity to a cat protein allergen by combining a blood sample from a subject with a peptide of human T cell reactive feline protein (hTRFP). This method and the hTRFP peptides are useful for diagnosing, preventing and treating cat allergies by reducing or abolishing an individual's allergic response to a cat allergen. DNA encoding the TRFP may be used as probes to locate equivalent sequences present in other species. These may further be used to study the mechanism of immunotherapy of cat allergy, and to design modified derivatives, analogues or functional equivalents useful in immunotherapy. The present or secuence was used in the invadition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   02-SEP-1994;

1

This invention describes a novel naturally occurring cat protein allergen (11), human T cell reactive feline protein (TRFP), comprising two different covalently linked peptide chains with a molecular weight of 20 kD, 40 kD or 130 kD under non-reducing conditions and 5 kD or 10-18 kD under reducing conditions. The products of the invention have antiallergic activity and act as human T cell stimulators. TRFP is useful for reducing or preventing the adverse effects of cat allergens on cat allergic individuals and in ex vivo diagnostic tests to determine which peptides cause sensitivity so as to selectively use them to desensitive a cat sensitive individual. Purified TRFP is also useful for studying the mechanism of immunotherapy of cat allergy and to design modified derivatives, analogs or functional equivalents that are more useful in immunotherapy against cat allergy. DNA sequences encoding TRFP are

New human T cell reactive feline protein useful for reducing or abolishing individual's allergic response to cat allergen comprising two different covalently linked peptide chains

Claim 2; Column 77-78; 106pp; English.

                              Detecting, preventing and treating sensitivity to cat protein allergen comprises combining a biological sample with a human {\tt T} cell reactive feline protein and determining the extent of binding that occurs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a modified human T-cell reactive feline protein which stimulates T-cells from an individual who is allergic to cats, but which interacts with human IgE to a lesser extent than does affinity purified TRPP! The protein is modified by treating with either a mild alkali (pH 12.5-13.5 , KOH, NaOH, LiOH or tertiary amines) or an enzyme which removes 0-linked groups (carbohydrate modieties). It is useful in desensitising people who are allergic to cats.

                                                                                                                                                                                               The present invention relates to the detection of sensitivity to a cat protein allergen by combining a blood sample from a subject with a peptide of human T cell reactive feline protein (hTREP). This method and the hTREP peptides are useful for diagnosing, preventing and treating cat allergies by reducing or abolishing an individual's allergic response to a cat allergen. DNA encoding the TREP may be used as probes to locate equivalent sequences present in other species. These may further be used to study the mechanism of immunotherapy of cat allergy, and to design modified derivatives, analogues or functional equivalents useful in immunotherapy. The present
                                                                                                                                                    Sequence

This invention describes a novel naturally occurring cat protein allergen (I), human T cell reactive feline protein (TRFP), comprising two

New human T cell reactive feline protein useful for reducing or abolishing individual's allergic response to cat allergen comprising two different covalently linked peptide chains

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC different covalently linked peptide chains with a molecular weight of 20 CC kD, 40 kD or 130 kD under non-reducing conditions and 5 kD or 10-18 kD CC under reducing conditions. The products of the invention have activity and act as human T cell stimulators. TREP is useful CC for reducing or preventing the adverse effects of cat allergens on cat CC allergic individuals and in ex vivo diagnostic tests to determine which CC peptides cause sensitivity so as to selectively use them to desensitize CC a cat sensitive individual. Purified TREP is also useful for studying CC the mechanism of immunotherapy of cat allergy and to design modified CC derivatives, analogs or functional equivalents that are more useful in immunotherapy against cat allergy. DNA sequences encoding TREP are CC useful as probes to locate equivalent sequences encoding TREP are CC (goats, sheep, dogs, rabbits or horses) that may be useful in diagnostics and/or therapeutics. Fully defined and characterized TREP provides CC complete and a very simple desensitization therapy. This sequence CC creates a human T cell reactive feline protein (also known as Fel d I) cc chain 2, long form which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

This sequence is a peptide chain of the human T cell reactive feline protein (TRRP) of the invention. The protein is a cat protein allergen, and was isolated from a vacuum bag extract obtained by affinity purification of house dust collected from several homes with cats. TRFP is composed of two covalently linked peptide chains, and is also referred to as Fel d I. TRFP and its peptides are useful for reducing or preventing the adverse effects that exposure to cat allergens normally has on cat allergic individuals (i.e. to desensitise individuals to cat allergens or block the effect of the allergens). TRFP is also used in methods of diagnosing sensitivity to Felis domesticus in an individual. DNA sequences present in other species, e.g. goat, sheep, horse, rabbit and dog, that may be useful in a diagnostic and/or therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                     New human T cell reactive feline protein, useful for desensitizing cat allergic individuals to cat allergens -

The peptides have reduced immunoglobulin E binding and reduce T cell responsiveness. The peptide (I) is useful in compositions for treating sensitivity to a cat protein allergen in a subject. This sequence represents the human TRFP chain 2 (long form).
                                                                                                                                                                                                                                                                                                                                                                                                                  Key

```
New pure covalently linked human T cell reactive feline protein and modified peptide(s), used to reduce effects of cat allergens and to diagnose sensitivity to allergens.
```

Claim 2; Fig 3; 70pp; English

Poly-A mRNA from cat parotid and mandibular glands was used to produce cDNA clones for both chain 1 and chain 2 of TRFP. These clones were then used to screen a cat genomic library. Chain 1 exists in two forms having different leader sequences (A and B). The sequence can be used to express the protein and peptide derivs. Which stimulate T-cells in persons allergic to cats. The peptides can be used to reduce/eliminate the allergic response partic. by modifice, of lymphokine prodm. by the T-cells. They can also be used to identify epitopes responsible for sensitivity. The DNA can be used to detect comparable sequence in other species, and also for prodm. of modified forms of TRFP esp. showing reduced binding to IgE and thus reduced tendency to cause adverse reactions.

T cell epitope studies using overlapping regions derived from the TRFP amino acids sequence were used identify multiple T cell epitopes in each chain of TRFP.

This invention describes a novel method of desensitizing a patient to a polypeptide allergen and comprises administering to the patient a peptide derived from the allergen where restriction to a MHC Class II molecule possessed by the patient can be demonstrated for the peptide and the peptide is able to induce a late phase response in an individual who possesses the MHC Class II molecule. The methods can be used for desensitising patients to allergens present in e.g. grass, tree and weed (including ragweed) pollens, fungi and moulds, foods, stinging insects, the chiromidae (non-biting midges), spiders and mites, housefly, fruit fly, sheep blow fly, screw worm fly, grain weevil, silkworm, honeybee,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein (TRFP). Peptides derived from TRFP may be used in a therapeutic composition which is useful in treating diseases which involve an immune response to a protein antigen. This composition may be used to induce tolerance in a mammal to Dermatophagoides,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Felis, Ambrosia, Lolium, Cryptomeria, Alternaria, Alder, Betula,

                                                 This sequence represents a modified human T-cell reactive feline protein which stimulates T-cells from an individual who is allergic to cats, but which interacts with human 1gE to a lesser extent than does affinity purified TRPP. The protein is modified by treating with either a mild alkali (pH 12.5-13.5 , KOH, NaOH, LiOH or tertiary amines) or an enzyme which removes 0-linked groups (carbohydrate moietties). It is useful in desensitising people who are allergic to ca
                                                                                                                                                                                                                                                                                                                                                                        Modified human T-cell reactive feline protein - stimulates T-cell in individuals allergic to cats and shows reduced histamine-releasing properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             non-biting midge larvae, bee moth larvae, mealworm, cockroach, larvae of Tenibrio molitor beetle, mammals such as cat, dog, horse, cow, pig, sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be used to produce immunological vaccines which may be used to prevent and/or treat conditions involving hypersensitivity to allergens. This sequence represents the cat allergen | 1082946 Fel dI chain 2 precursor.

                  The present invention relates to the detection of sensitivity to a cat protein allergen by combining a blood sample from a subject with a peptide of human T cell reactive feline protein (hTRFP). This method and the hTRFP peptides are useful for diagnosing, preventing and treating cat allergies by reducing or abolishing an individual's allergic response to a cat allergen. DNA encoding the TRFP may be used as probes to locate equivalent sequences present in other species. These may further be used to study the mechanism of immunotherapy of cat allergy, and to design modified derivatives, analogues or functional equivalents useful in immunotherapy. The present sequence was used in the invention.
                                                                                                                                                                                                                                                                                                                                                                         25-MAR-1992;

derivatives, analogs or functional equivalents that are more useful in immunotherapy against cat allergy. DNA sequences encoding TRFP are useful as probes to locate equivalent sequences present in other species (goats, sheep, dogs, rabbits or horses) that may be useful in diagnostics and/or therapeutics. Fully defined and characterized TRFP provides complete and a very simple desensitization therapy. This sequence represents a human T cell reactive feline protein (also known as Fel d I)
                                                                                            (I), human T cell reactive feline protein (TRFP), comprising two different covalently linked peptide chains with a molecular weight of 20 kD, 40 kD or 130 kD under non-reducing conditions and 5 kD or 10-18 kD under reducing conditions. The products of the invention have antiallergic activity and act as human T cell stimulators. TRFP is useful for reducing or preventing the adverse effects of cat allergens on cat allergic individuals and in ex vivo diagnostic tests to determine which peptides cause sensitivity so as to selectively use them to desensitize a cat sensitive individual. Purified TRFP is also useful for studying the mechanism of immunotherapy of cat allergy and to design modified design modified for studying the mechanism of immunotherapy of cat allergy and to design modified
                                                                                                                                                                                                                                                                                                                                                                                                         Kuo
                                                                                                                                                                                                                                                                   Claim

This sequence is a peptide chain of the human T cell reactive feline protein (TRFP) of the invention. The protein is a cat protein allergen, and was isolated from a vacuum bag extract obtained by affinity purification of house dust collected from several homes with cats. TRFP is composed of two covalently linked peptide chains, and is also referre to as Fel d I. TRFP and its peptides are useful for reducing or preventing the adverse effects that exposure to cat allergens normally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chain

This invention describes a novel peptide (I) of human T cell reactive feline protein (hTRFP) having at least one T cell epitope recognized by a T cell receptor specific for the human T cell reactive feline protein, the peptide consisting of at least 7-30 amino acids, and having an amino acid sequence derived from an amino acid sequence comprising 9, 97, 109, or 111 residues; given in the specification. The peptides down regulate the immune response to the allergen. The peptides have
                                                                                                                                  Peptides of human T cell reactive feline protein sensitivity to cat protein allergens comprise at epitope recognized by a T cell receptor specific reactive feline protein -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        T-cell reactive feline protein; TRFP, T cell epitope; T cell down regulation; immune response; allergen; immunoglobulin E; sensitivity; cat protein allergen; human; chain 2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   has on cat allergic individuals (i.e. to desensitize individuals to cat allergens or block the effect of the allergens). TRFP is also used in methods of diagnosing sensitivity to Felis domesticus in an individual. DNA sequences encoding TRFP can be used as probes to locate equivalent sequences present in other species, e.g. goat, sheep, horse, rabbit and dog, that may be useful in a diagnostic and/or therapeutic applications
                                                                                                                                                                                                                                                                    (IMMU-) IMMULOGIC

Poly-A mRNA from cat parotid and mandibular glands was used to produce cDNA clones for both chain 1 and chain 2 of TRFP. These clones were then used to screen a cat genomic library. Chain 1 exists in two forms having different leader sequences (A and B). The sequence can be used to express the protein and peptide derivs which stimulate T-cells in persons allargic to cats. The peptides can be used to reduce/eliminate the allergic response partic. by modifice, of lymphokine prode, by the T-cells. They can also be used to identify epitopes responsible for sensitivity. The DNA can be used to detect comparable sequence in other species, and also
                                                                                                                                                                                                                                                                         Gefter

ALPHA-7 ASSOCIATES WITH BETA-1.

-! SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-!- ALTERNATIVE PRODUCTS: AT LEAST 3 ISOFORMS; ALPHA-7XIA, ALPHA-7XIB

(SHOWN HERE) AND ALPHA-7XIC; ARE PRODUCED BY ALTERNATIVE SPLICING.

-!- TISSUE SPECIFICITY: EXPRESSED IN SKELFFAL AND CARDIAC MUSCLE.

EXPRESSED IN REPLICATING MYOBLASTS. IN DIFFERENTIATED MUSCLE

FIBERS LOCALIZES BETWEEN FIBERS AND THE SURROUNDING MATRIX.

ISOFORMS A AND B ARE EXPRESSED AT MYOTENDINOUS AND MEUROMUSCULAR

JUNCTIONS; ISOFORM C IS EXPRESSED AT NEUROMUSCULAR JUNCTIONS AND

AT EXTRASYNAPTIC SITES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DEVELOPMENTAL STAGE: ISOFORMS ARE DEVELOPMENTALLY REGULATED DURING THE FORMATION OF SKELETAL MUSCLE. ISOFORMS A AND C ARE INDUCED UPON TERMINAL MYOGEBUIC DIFFERENTIATION; ISOFORM B IS PRESENT EARLIER IN REPLICATING CELLS AND DIMINISHES UPON DIFFERENTIATION. PTM: ADD-RIBOSYLATED ON AT LEAST TWO SITES IN THE EXTRACELLULAR DOMAIN IN SKELETAL MYOTUBES (BY SIMILIARITY).

SIMILARITY: BELONGS TO THE INTEGRIN ALDHA CHAIN FAMILY.

SIMILARITY: CONTAINS 7 FG-GAP REPEATS.
                                                                                                                                                                                                                                      1032

-1- FUNCTION: INTEGRIN ALPHA-7/BETA-1 IS THE PRIMARY LAMININ RECEPTOR ON SKELETAL MYOBLASTS AND ADULT MYOFIBERS. DURING MYOGENIC ON SKELETAL MYOBLASTS AND ADULT MYOFIBERS. DURING MYOGENIC ON SKELETAL MYOBLASTS AND ADULT MYOFIBERS. DURING MYOGENIC ON SKELETAL MYOBLASTS AND ADULT MYOFIBERS IN THE SHAPE AND MOBILITY DIF MYOBLASTS, AND FACILITATE THEIR LOCALIZATION AT LAMININ-RICH SITES OF SECONDARY FIBER FORMATION. IT IS INVOLVED IN THE MAINTENANCE OF THE MYOFIBERS CYTOARCHITECTURE AS WELL AS FOR THEIR ANCHORAGE, VIBBLITY AND FUNCTIONAL INTEGRITY. ISOCOMS ALPHA-7X2B AND ALPHA-7X1B PROMOTE MYOBLAST MIGRATION ON LAMININ 1 AND LAMININ 1 AND LAMININ 1 (IN VITRO).

-1. SUBUNIT IS COMPOSED OF AN HEAVY AND A BETM SUBUNIT. THE ALPHA SUBUNIT IS COMPOSED OF AN HEAVY AND A LIGHT CHAIN LINKED BY A DISULFIDE BOND. ALPHA-7 ASSOCIATES WITH BETA-1.

```

```
EXPRESSED AT LOW LEVELS IN FETAL AND ADULT SKELETAL MUSCLE AND IN CARDIAC MUSCLE, BUT ARE NOT DETECTED IN WYODLASTS AND MYOTUBES. IN MUSCLE FIBERS ISOFORMS CONTAINING SEGMENT A AND B ARE EXPRESSED AT MYOTENDINOUS AND NEUROMUSCULAR JUNCTIONS; ISOFORMS CONTAINING SEGMENT C ARE EXPRESSED AT NEUROMUSCULAR JUNCTIONS AND AT EXTRASYNAPTIC SITES. ISOFORMS CONTAINING SEGMENTS X1 OR X2 OR, AT LOW LEVELS, X1X2 ARE EXPRESSED IN FETAL AND ADULT SKELETAL MUSCLE (MYOBLASTS AND MYOTUBES) AND CARDIAC MUSCLE.

DEVELOPMENTAL STAGE: IN RENEWING INTESTINAL EPITHELIUM, EXPRESSION OF ISOFORMS CONTAINING SEGMENT B CORRELATES WITH THE ONSET OF ENTEROCYTIC DIFFERENTIATION.
```

EXTRACELLULAR

PTM: ADP-RIBOSYLATED ON AT LEAST TWO SITES OF THE EXTRACELL DOMAIN IN SKELETAL MYOTUBES (BY SIMILARITY).
DISEASE: DEFECTS IN ITGA7 ARE ASSOCIATED WITH A FORM OF CON MYOPATHY; A GROUP OF HETEROGENEOUS MUSCLE DISORDERS WHICH A THOUGHT TO RESULT FROM ABNORMAL MUSCLE DEVELOPMENT. MUSCLE WEAKNESS IS EITHER NON-PROGRESSIVE OR SLOWLY PROGRESSIVE AN APPARENT FROM BIRTH OR EARLY INFANCY.
SIMILARITY: BELONGS TO THE INTEGRIN ALPHA CHAIN FAMILY.
SIMILARITY: CONTAINS 7 FG-GAP REPEATS. FORM OF CONGENITAL AND
